

Everything Netcare does for you, in plain terms.

No jargon, no settings menus — just what changes for you day to day: your patients, your schedule, your prescriptions, and the small things that used to eat up time between one patient and the next.

1 screen For every patient's full history	0 Paper charts to carry or misplace	Live Lab results, the moment they're ready	Anywhere Phone, tablet, or the desk PC
--	--	---	---

01 Your day, at a glance

Open Netcare and see what actually matters this morning — not a menu you have to dig through.

- **Today's appointments** — who's booked, at what time, and whether they've arrived — without calling the front desk.
- **Waiting on you** — lab results ready for your review, and pharmacy or lab orders you placed that are still moving.
- **One tap into a patient's chart** — from the appointment list straight to their full history, no searching by name twice.

02 A patient's whole story, in one place

Every visit, every prescription, every test this patient has ever had at your hospital — not scattered across a paper file and three different logins.

- **Full history on one screen** — past visits, vitals, prescriptions, lab results and consultations, in order, without flipping pages.
 - **Vitals the moment they're taken** — a nurse records blood pressure or temperature and it's on the chart before the patient even sits down with you.
 - **Nothing hospital-hopping can confuse** — you only ever see this hospital's own patients and records, never mixed up with another branch or another clinic's data.
-

03 Your schedule, under your control

Block out the time you're actually unavailable, and let the system handle the rest.

- **Block your own unavailable time** — a half-day off, a conference, a surgery slot — set it yourself, no request form to the admin.
 - **No accidental double-booking** — the system won't let the same patient be booked into the same department twice in one day, so your list doesn't fill up with duplicates.
 - **Video consultations on the same calendar** — a video slot books, reschedules and shows up alongside your in-person appointments, not in a separate app.
-

04 Writing a prescription

Faster to write, and impossible to mix up with someone else's.

- **Always signed by you, automatically** — a prescription is tied to whichever doctor is actually logged in. There's no field to accidentally type the wrong name into.
 - **See what they're already on** — a patient's current and past prescriptions are right there while you're writing the new one.
 - **Medicine and injection orders, stock-checked** — if the pharmacy is out of something or a batch has expired, the system stops the order before it becomes a problem at the counter, instead of after.
-

05 Ordering a lab test

Order it, get told the moment it's back, and see the result before it reaches the patient.

- **Order directly from the patient's chart** — no separate lab requisition slip to fill out by hand.
 - **Notified when the result lands** — you find out the same way you'd expect: a notification, not a phone call from the lab.
 - **You see it before the patient does** — a result passes through a review step, so you can put it in context before it's released.
-

06 Maternity & child health, if that's your practice

Pregnancy through infancy, tracked as one continuous story instead of separate files.

- **Pregnancy record with the visit history attached** — every ANC visit logged against it, so the full picture is there at the next appointment.
- **A baby's record linked to the mother's from birth** — not a fresh, disconnected file to start from scratch.
- **Growth and immunizations tracked over time** — measurements plotted against standard growth curves, immunizations scheduled and marked off as given.

07 What you don't have to think about

The parts that happen in the background, on purpose.

- **Billing takes care of itself** — the consultation fee, pharmacy charges and lab charges land on the patient's invoice automatically. You don't need to work out what to charge.
- **Your patients' data stays private to your hospital** — nothing you write is visible to another hospital on the platform, and no one outside your hospital's own staff can see it either.
- **Consent is handled properly** — for anything that needs a patient's explicit sign-off (like a video consultation you initiate, or a minor's guardian consenting on their behalf), the system asks and keeps the record — not a form that goes missing in a file.

Works on whatever you already have. There's no separate app to install for staff — Netcare runs in a browser, on your phone between patients or on the desk PC in your consulting room, and looks the same either way.

Less time on paperwork, more time with the patient in front of you.

That's the whole point of the parts described here — not a new system to learn for its own sake, but the same work you already do, without the parts that used to slow it down.
